DESCRIPTIVE ANALYTICS REPORT

Flipkart E-Commerce Product & Service Performance Analysis

Submitted By

Name: Anuj Kumar

Roll No.: 1250258107

University: Babu Banarasi Das University

Course: Business Analytics / Descriptive Analytics

Academic Year: 2026

Dataset note: This report uses a clearly labelled simulated Flipkart-style e-commerce dataset created for academic descriptive analysis. It is not presented as official Flipkart sales data.

Prepared in accordance with the supplied assignment brief.

Appendix A: Sample Dataset	23
Appendix B: Calculation Notes	24

The main report is structured to demonstrate the techniques required in the assignment brief: aggregation, central tendency, spread, frequency distribution, cross-tabulation, trend analysis and visualization. The appendix is excluded from the main page-count target.

3. Executive Summary

This report applies descriptive analytics to a simulated Flipkart-style e-commerce dataset containing 300 order-level observations across 12 months, six product categories and six Indian states. The purpose is to demonstrate how raw transaction data can be converted into summarized business information using descriptive techniques.

The simulated dataset records total sales of ■**2,318,341**, total profit of ■**510,587** and **450** units sold. The average order sale price is ■**7,728**, while the median is ■**3,014**. The overall mean customer rating is **4.01/5**. The largest category by sales is **Electronics**, and the strongest state in the simulated sample is **Delhi**.

The analysis demonstrates aggregation, mean/median/mode, variance and standard deviation, frequency distribution, category-by-gender cross-tabulation, monthly trend analysis, and multiple visualizations. Because the dataset is simulated, the numerical results should be interpreted as an academic demonstration rather than as actual Flipkart business performance.

> **Overall descriptive message: the simulated order portfolio is led by a small number of higher-value categories, with sales distributed across regions and payment methods. Monthly sales show visible variation rather than a flat pattern, while ratings are concentrated around the upper end of the scale.**

The recommendations at the end are intentionally brief and descriptive, in line with the assignment requirement that the report should focus on what happened and what the data shows rather than predictive modelling.

4. Introduction

Flipkart is used in this report as the chosen e-commerce service because an online marketplace naturally produces transaction-level variables such as product category, order value, quantity, payment method, region and customer rating. These variables are suitable for descriptive analytics because they can be aggregated and compared without requiring a predictive model.

The report is not intended to estimate Flipkart's actual revenue, market share or official customer behaviour. Instead, it constructs a realistic academic dataset that mirrors the type of information an e-commerce analyst might examine.

Why this topic? E-commerce performance can be understood through simple but powerful descriptive questions: Which categories contribute most sales? Which regions generate higher order values? How are payment methods distributed? How do sales change month by month? What does the rating distribution look like?

These questions directly match the assignment brief's central question of descriptive analytics: “what happened, and what does the data show us?”

> **Analytical unit: one row represents one simulated order. The dataset contains 300 rows and 14 variables.**

5. Objectives and Scope

The main objectives of this report are:

1. Construct a sufficiently detailed simulated dataset for Flipkart-style e-commerce transactions.
2. Clean and organize the data into analysis-ready fields.
3. Calculate aggregate sales, profit, quantity and order counts.
4. Demonstrate mean, median and mode for relevant variables.
5. Measure variability using range, variance and standard deviation.
6. Build frequency distributions for ratings and categories.
7. Compare two variables through cross-tabulation.
8. Examine monthly sales and profit trends.
9. Present findings using clear charts and tables.
10. Provide concise recommendations based only on the descriptive evidence.

Scope is limited to the variables present in the simulated dataset: category, state, gender, quantity, pricing, discount, sale price, purchase cost, profit, rating, delivery time and payment method.

> **No forecasting, machine learning or causal inference is performed. This keeps the analysis aligned with the assignment brief.**

6. Data Collection and Methodology

Data source: Simulated dataset created specifically for this academic report. The assignment brief permits a realistic simulated dataset when real data is unavailable, provided it is clearly labelled as simulated.

Sample size: 300 simulated orders covering January–December 2025, with 25 observations generated per month.

Variables: Order ID, Month, Category, State, Gender, Quantity, Unit Price, Discount %, Sale Price, Purchase Cost, Profit, Rating, Delivery Days and Payment Method.

Tools: Python was used to construct the dataset, calculate descriptive statistics and create charts; the final report was formatted as a PDF.

Method: data were grouped by time, category, state, gender and payment method. Measures of central tendency and spread were calculated from order-level values. Frequency counts were used for rating bands. A category × gender sales matrix was used for cross-tabulation.

Limitations: the values are simulated; therefore, the report cannot be used to claim actual Flipkart sales, customer behaviour or regional market performance. The sample is also designed for teaching rather than statistical estimation of a real population.

7. Dataset Structure

Order_ID	Month	Category	State	Gender	Quantity	Unit_Price	Discount_%	Sale_Price	Purchase_Cost	Profit	Rating
100001	Jan-2025	Fashion	West Bengal	Male	1	■1,877	11.38	■1,564	1207.05	■357	3.51
100002	Jan-2025	Beauty	West Bengal	Female	1	■1,389	9.67	■1,179	873.61	■306	2.56
100003	Jan-2025	Fashion	Maharashtra	Male	4	■2,112	11.18	■9,153	7355.76	■1,797	4.08
100004	Jan-2025	Home & Kitchen	West Bengal	Female	1	■3,797	16.74	■2,972	2078.67	■893	3.67
100005	Jan-2025	Electronics	West Bengal	Female	1	■20,176	8.48	■17,357	13278.9	■4,078	4.18
100006	Jan-2025	Electronics	Delhi	Female	3	■20,686	12.86	■63,813	44522.34	■19,291	3.45
100007	Jan-2025	Fashion	West Bengal	Female	1	■1,865	6.76	■1,634	1165.25	■469	3.98
100008	Jan-2025	Fashion	Maharashtra	Male	2	■2,446	12.87	■5,200	4213.06	■987	3.51
100009	Jan-2025	Fashion	Rajasthan	Male	2	■2,175	17.02	■3,176	2235.69	■940	4.54
100010	Jan-2025	Home & Kitchen	Rajasthan	Male	1	■4,258	10.5	■3,354	2491.45	■862	4.5

The preview illustrates the structure of the simulated order-level data. Numeric fields are suitable for aggregation and descriptive statistics, while categorical fields support frequency tables and cross-tabulation.

Field	Type	Purpose
Order_ID	Identifier	Unique simulated order reference
Month	Categorical/time	Monthly trend analysis
Category	Categorical	Product grouping
State	Categorical	Regional comparison
Gender	Categorical	Cross-tab comparison
Quantity	Numeric	Units ordered
Sale_Price	Numeric	Order sales value
Profit	Numeric	Sales less simulated purchase cost
Rating	Numeric	Customer rating
Payment_Method	Categorical	Payment mix analysis

8. Data Cleaning and Preparation

The simulated dataset was generated in a structured form, so major data-cleaning problems were deliberately minimized. The preparation process nevertheless follows the same logic that would be applied to a real e-commerce dataset.

1. Duplicate check: Order_ID was generated uniquely for every observation, allowing duplicate orders to be identified by the primary identifier.

2. Missing values: the final analysis dataset contains no blank analytical fields. This avoids distorted aggregates caused by accidental missing entries.

3. Numeric formatting: prices and profits were rounded to two decimal places; ratings were limited to the 1–5 scale and delivery days to a realistic positive range.

4. Category consistency: category, state, gender and payment values use a fixed set of labels so that grouping operations do not split the same category into different spellings.

5. Derived fields: sale price and profit were calculated from simulated unit price, quantity, discount and purchase cost. These derived measures make the dataset suitable for profitability analysis.

> **The prepared dataset is therefore analysis-ready and supports aggregation, frequency tables, cross-tabulation and monthly trend analysis.**

9. Descriptive Statistics

The following table summarizes the principal numerical variables at order level.

Variable	Mean	Median	Std. Dev.	Minimum	Maximum
Sale Price	■7,728	■3,014	■12,375	■592	■92,993
Profit	■1,702	■622	■2,904	■84	■22,449
Quantity	1.50	1	0.80	1	4
Rating	4.01	4.01	0.52	2.56	5.00
Delivery Days	3.26	3.20	1.08	1.0	6.5

The average order sale price is ■7,728 and the median is ■3,014. The overall simulated profit margin is 22.0%. The average rating of 4.01 indicates that most simulated orders fall toward the positive end of the 1–5 scale.

10. Data Aggregation

Aggregation converts individual orders into meaningful business summaries. In this report, totals are calculated for sales, profit, quantity and number of orders.

Measure	Result
Total simulated sales	■2,318,341
Total simulated profit	■510,587
Total units sold	450
Number of orders	300
Average order sale price	■7,728
Overall simulated profit margin	22.0%

Category aggregation is particularly useful because it reveals which product groups contribute the largest amount of sales rather than simply counting orders.

Category	Sales	Profit	Orders	Avg Rating
Electronics	■1,583,003	■354,209	58	4.02
Home & Kitchen	■296,479	■62,317	56	4.01
Fashion	■218,981	■47,837	68	3.96
Beauty	■94,329	■19,039	42	4.05
Grocery	■88,566	■19,461	48	3.99
Books	■36,983	■7,724	28	4.07

11. Measures of Central Tendency

Central tendency identifies a typical or central value. Mean uses every observation, median identifies the middle observation after sorting, and mode identifies the most frequently occurring category.

Sale price: mean = ■7,728; median = ■3,014. The difference between these values reflects the influence of higher-value electronic orders in the simulated portfolio.

Rating: mean = 4.01; median = 4.01. The close values suggest that the distribution is concentrated around a common rating level.

Category mode: Fashion is the most frequent category in the simulated dataset.

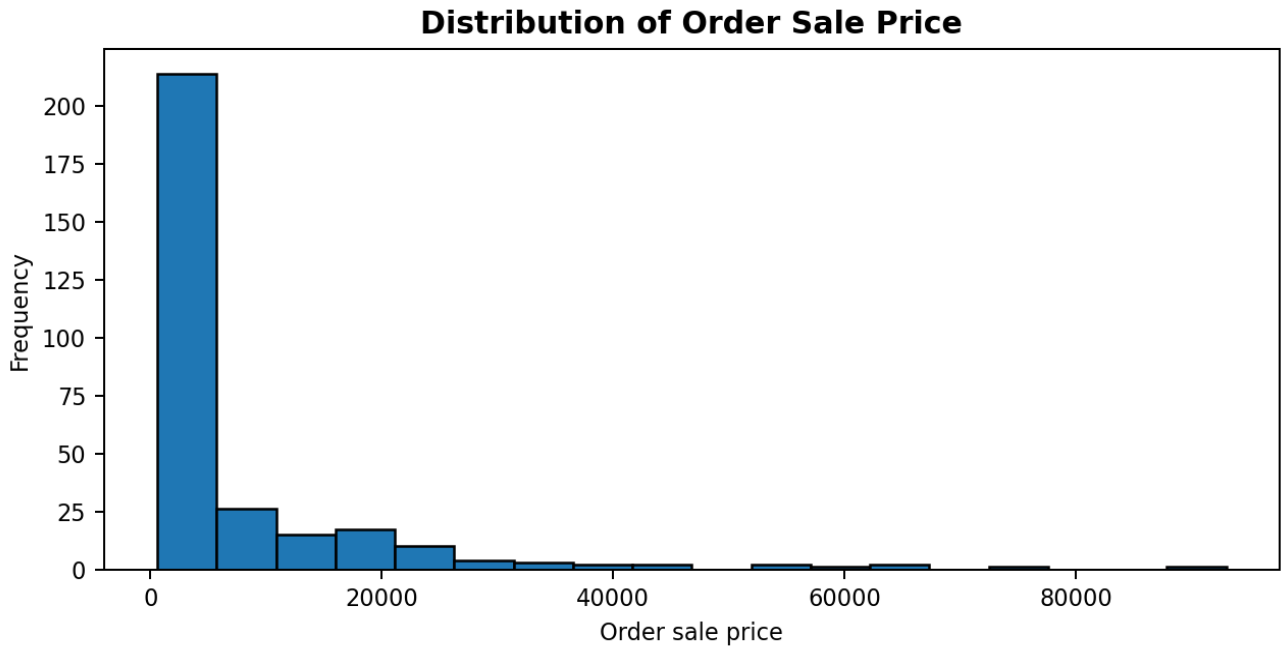

Figure 1. The distribution of order sale prices shows the spread created by multiple product categories and different order quantities.

For an e-commerce analyst, mean and median should be read together. A mean can be pulled upward by expensive orders, while the median gives a more typical order-level position.

12. Measures of Spread

Measures of spread describe how much observations vary around their central values. This is important because two datasets can have the same average but very different levels of variability.

Measure	Sale Price	Interpretation
Range	■92,401	Distance between the smallest and largest simulated order values.
Variance	153,142,172	Squared measure of variability around the mean.
Standard deviation	■12,375	Typical dispersion of order sale price around the mean.

The sale-price range is ■92,401. The standard deviation is ■12,375, showing that order values vary substantially because the dataset intentionally mixes lower-value categories such as Books and Grocery with higher-value categories such as Electronics.

> **This is a descriptive finding, not evidence that one category is inherently better. It simply shows that category mix creates a wide order-value distribution.**

13. Frequency Distribution

Frequency distribution counts how often values or categories occur. Here, customer ratings are grouped into four bands to make the overall rating pattern easier to interpret.

Rating Band	Orders	Share
1–2	0	0.0%
3	8	2.7%
4	141	47.0%
5	151	50.3%

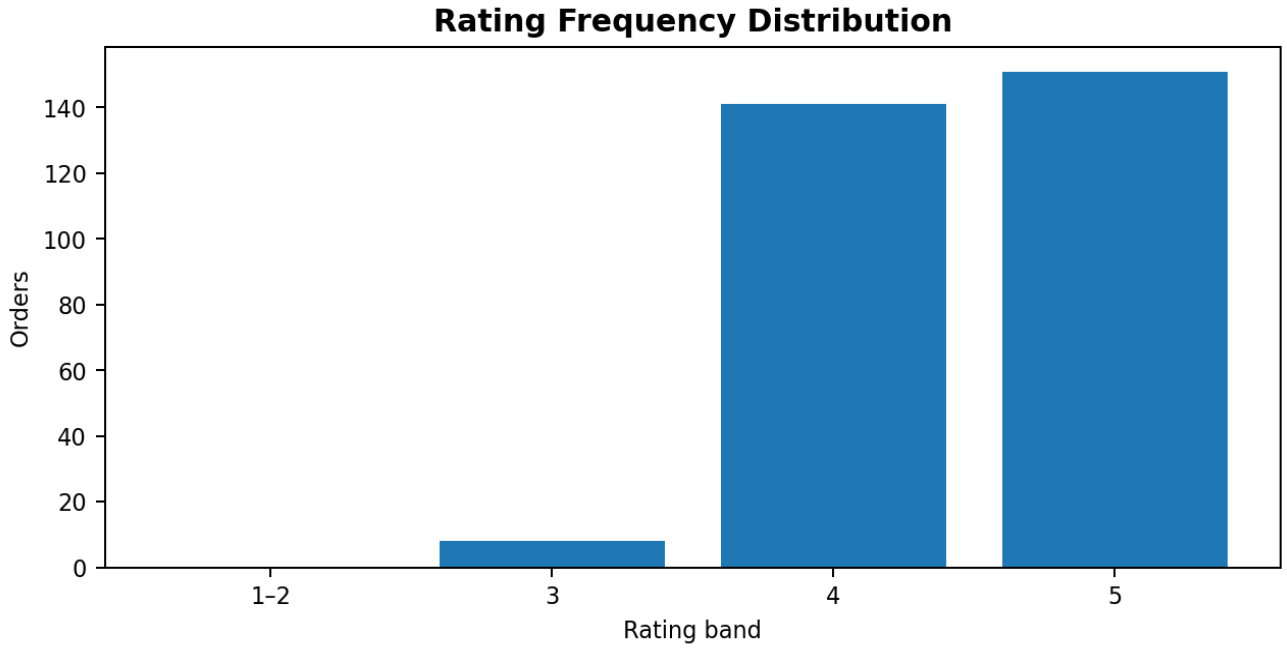

Figure 2. Rating frequency distribution for the simulated orders.

The distribution is concentrated toward the higher rating bands. This suggests that low ratings are less common in the simulated sample, although the result cannot be generalized to actual Flipkart customers because the dataset is simulated.

14. Cross-Tabulation: Category × Gender

Cross-tabulation compares two categorical dimensions at the same time. The table below shows simulated sales by product category and gender.

Category	Male Sales	Female Sales	Total
Beauty	■48,714	■45,615	■94,329
Books	■16,107	■20,876	■36,983
Electronics	■745,051	■837,952	■1,583,003
Fashion	■135,898	■83,083	■218,981
Grocery	■51,072	■37,494	■88,566
Home & Kitchen	■167,635	■128,844	■296,479

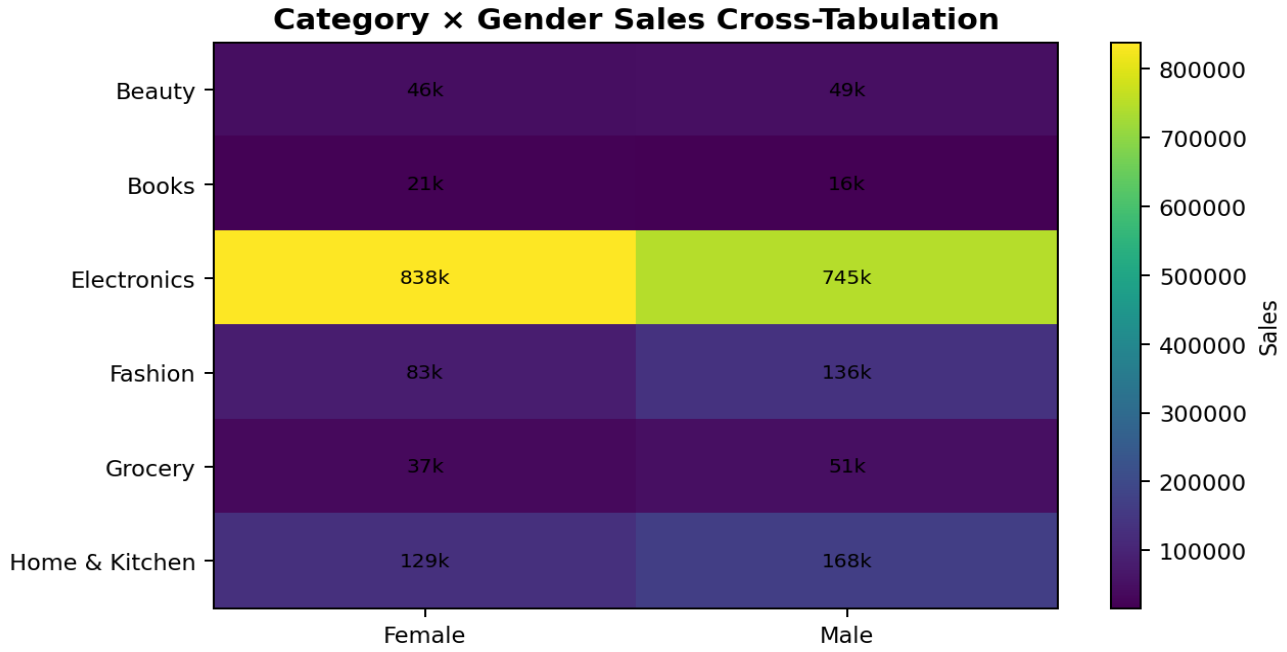

Figure 3. Category × gender sales heat map. Values are simulated and shown in thousands of rupees.

The cross-tab allows category-level differences to be seen alongside gender-level differences. It is more informative than a single overall gender total because it shows where the sales mix is concentrated.

15. Trend Analysis

Trend analysis tracks a metric across ordered time periods. The monthly sales and profit series below show how the simulated business changes over 2025.

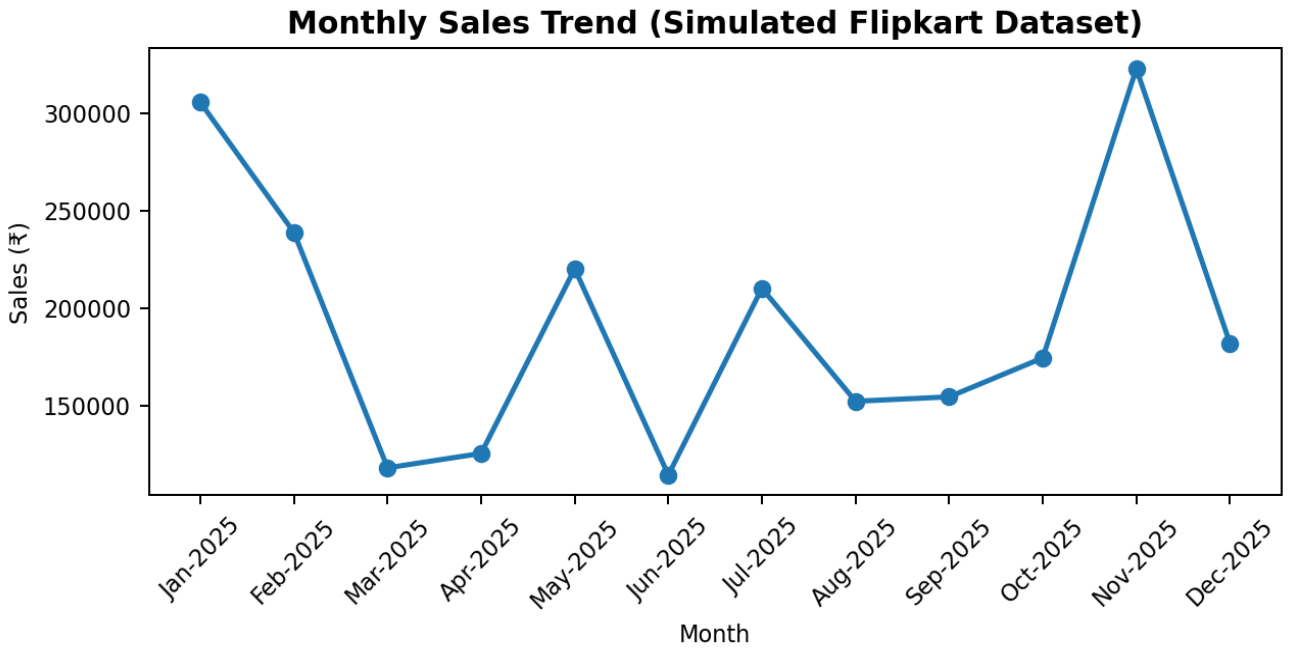

Figure 4. Monthly simulated sales trend across January–December 2025.

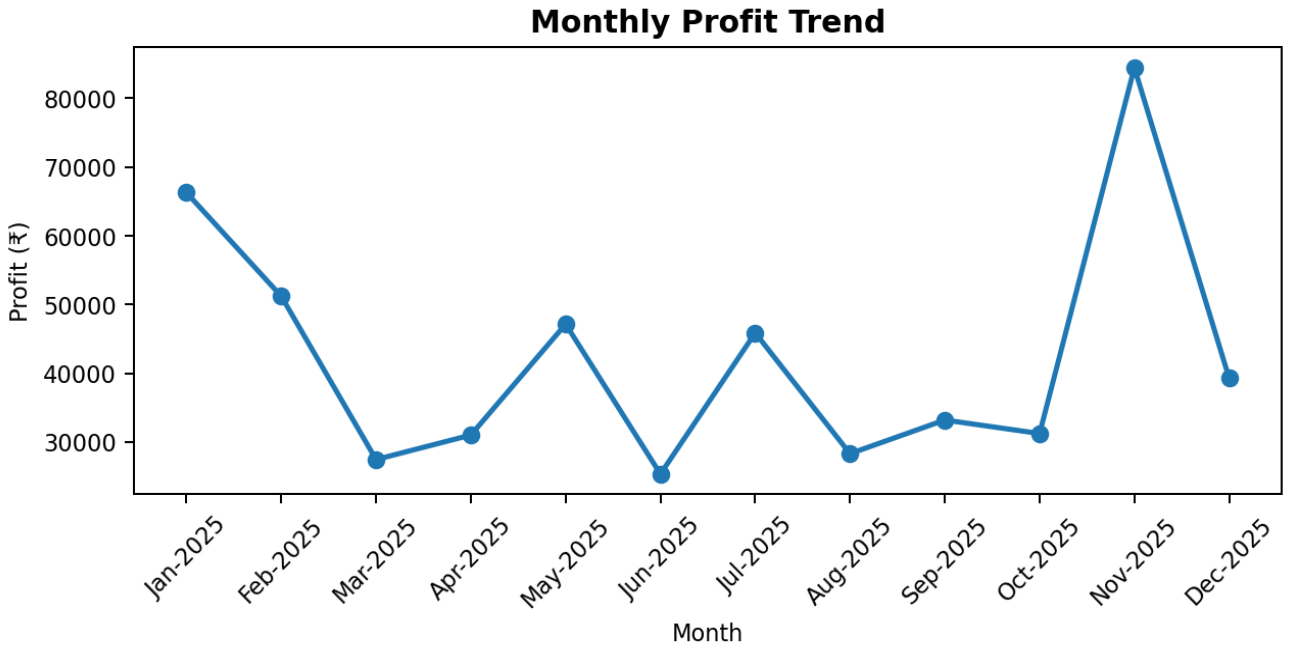

Figure 5. Monthly simulated profit trend across January–December 2025.

The highest simulated monthly sales occur in **Nov-2025** at ■322,669, while the lowest occur in **Jun-2025** at ■114,406. The month-to-month variation indicates that sales are not evenly distributed across the year.

16. Sales by Product Category

Category analysis identifies the relative contribution of product groups to total sales. This is one of the most useful descriptive views for an e-commerce dataset because it separates the portfolio into understandable business segments.

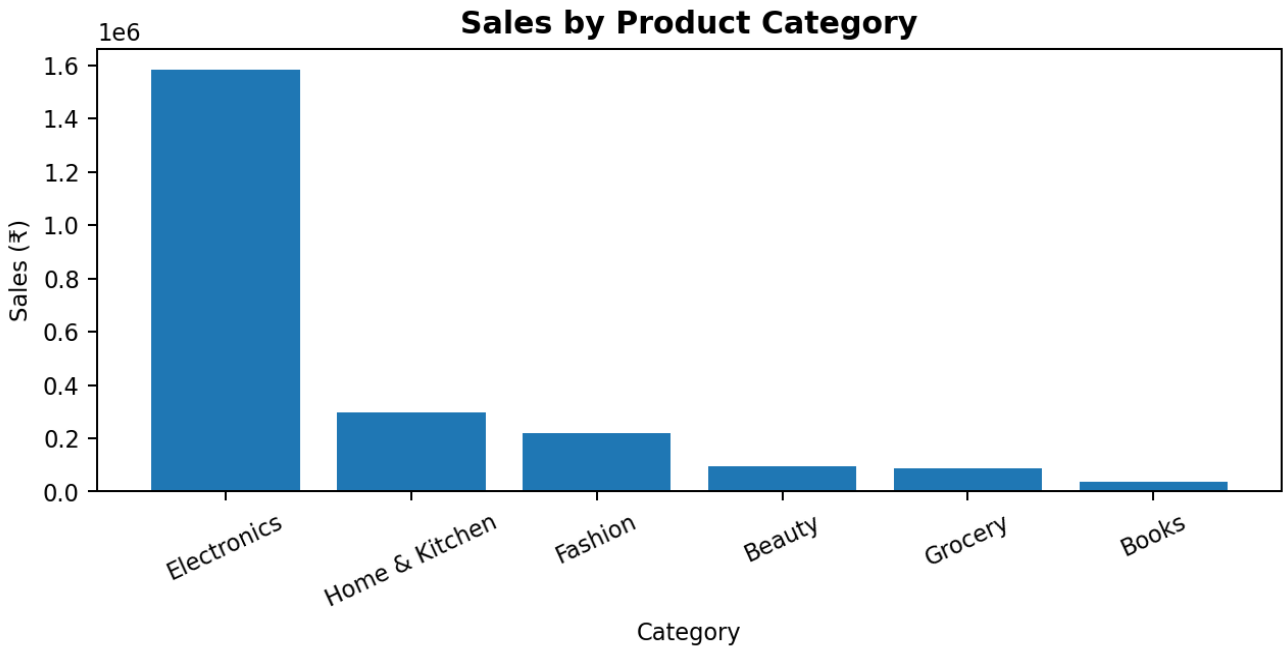

Figure 6. Simulated sales by category.

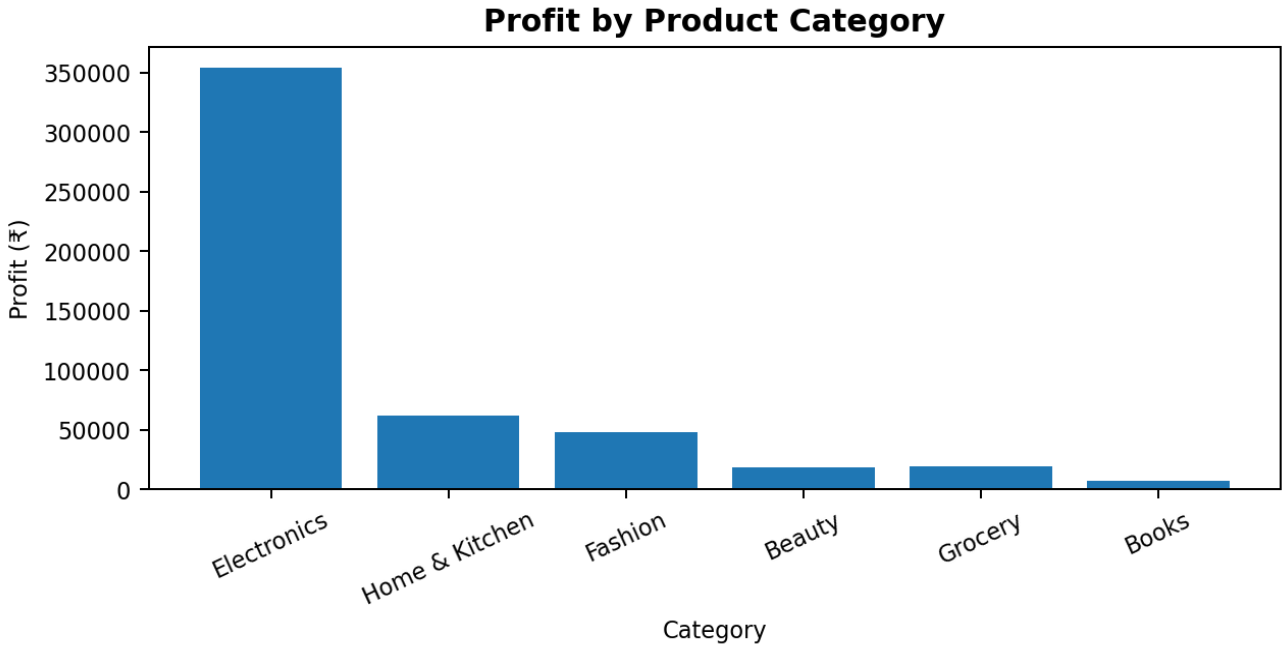

Figure 7. Simulated profit by category.

Highest sales category: Electronics with ■1,583,003 in simulated sales. **Lowest sales category:** Books with ■36,983.

Sales leadership and profit leadership should be examined together. A category can generate high sales while having a different profit contribution because profit depends on purchase cost and discount assumptions in the simulated data.

17. Sales by Region / State

Regional aggregation helps identify where the simulated orders are concentrated. Six states are included in the dataset.

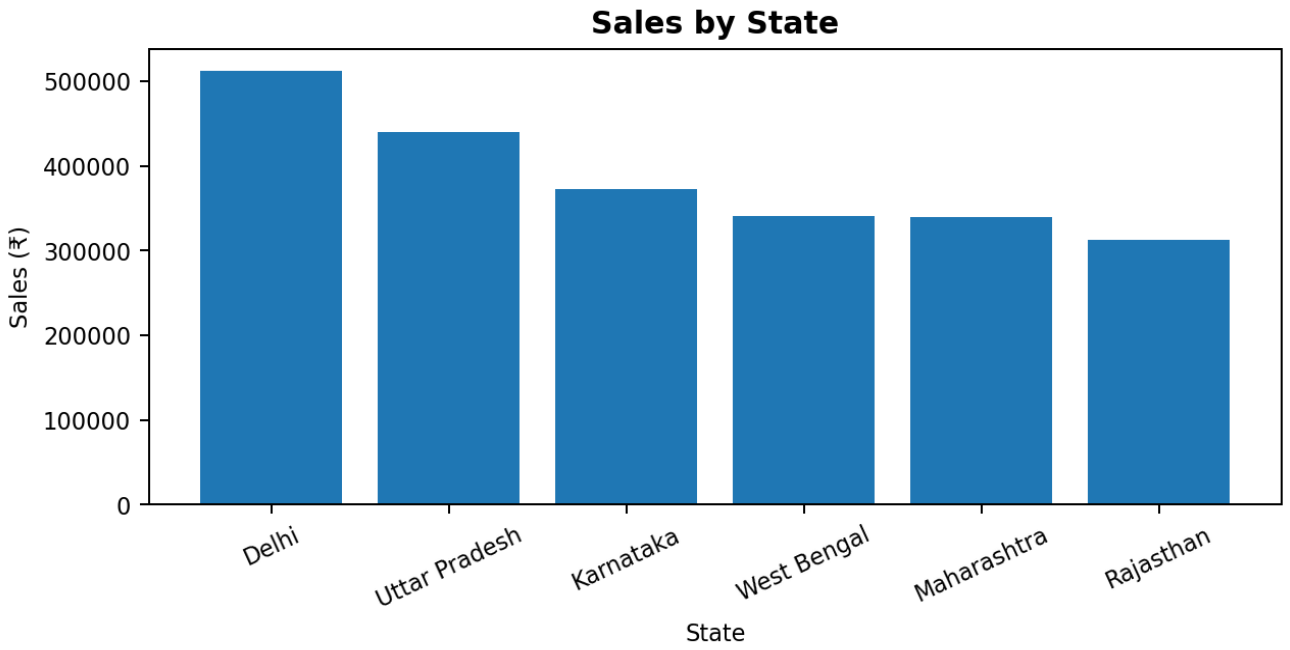

Figure 8. Simulated sales by state.

State	Sales	Profit	Orders
Delhi	■512,469	■111,698	51
Uttar Pradesh	■439,921	■95,489	47
Karnataka	■373,094	■80,167	52
West Bengal	■340,720	■72,070	55
Maharashtra	■339,269	■79,554	47
Rajasthan	■312,869	■71,608	48

The strongest state in the simulated dataset is **Delhi**. The regional results should be read as a feature of the constructed sample, not as official Flipkart regional performance.

18. Payment Method Analysis

Payment method analysis describes how sales are distributed across UPI, cards, cash on delivery and net banking.

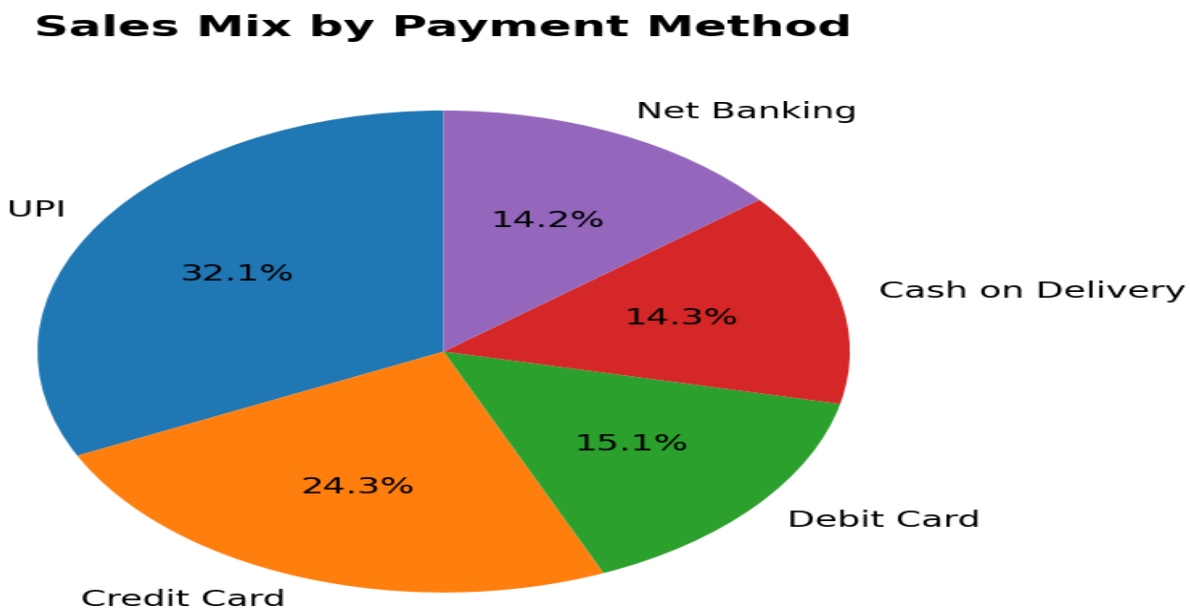

Figure 9. Simulated sales mix by payment method.

Payment Method	Sales	Share
UPI	■744,438	32.1%
Credit Card	■564,064	24.3%
Debit Card	■349,449	15.1%
Cash on Delivery	■332,021	14.3%
Net Banking	■328,369	14.2%

The chart highlights the relative contribution of each payment method to total simulated sales. Because this is an order-value mix, the largest share does not necessarily mean the largest number of transactions.

19. Key Findings

1. Overall scale: the simulated dataset contains 300 orders and 450 units, generating ■2,318,341 in sales and ■510,587 in profit.

2. Typical order value: the mean sale price is ■7,728 and the median is ■3,014, indicating that higher-value orders influence the average.

3. Category concentration: Electronics is the largest category by simulated sales, while Books is the smallest.

4. Regional variation: Delhi records the highest simulated sales among the six states included.

5. Customer ratings: the mean rating is 4.01/5 and the frequency distribution is concentrated in the upper rating bands.

6. Time variation: monthly sales range from ■114,406 to ■322,669, showing clear month-to-month movement.

7. Payment mix: payment methods contribute different shares of total simulated sales, making payment segmentation useful for descriptive reporting.

> **Taken together, the findings show how descriptive analytics can transform order-level data into a compact picture of sales, profitability, category mix, geography, customer ratings and payment behaviour.**

20. Recommendations

The following recommendations are intentionally descriptive and practical, rather than predictive, in line with the assignment brief.

1. Monitor high-contribution categories: category-level sales and profit should be reviewed regularly so that large contributors remain visible in management dashboards.

2. Track monthly variation: monthly sales should be summarized consistently because the simulated data shows meaningful differences between months.

3. Segment reporting by region: state-level summaries can help analysts understand where sales are concentrated and where order activity is comparatively lower.

4. Review rating distributions: ratings should be reported using both average values and frequency bands so that the overall customer-experience pattern is not reduced to a single number.

5. Keep payment reporting separate from order counts: sales value and transaction count can tell different stories, so both should be included in a dashboard.

6. Maintain clean category labels: consistent naming is essential for reliable aggregation and cross-tabulation.

> **These recommendations do not claim that a specific strategy will cause future growth. They simply identify reporting practices that are supported by the descriptive evidence in the dataset.**

21. Conclusion

This report demonstrates a complete descriptive analytics workflow for a Flipkart-style e-commerce dataset. Starting from 300 simulated order records, the analysis organized the data, calculated summary measures, examined distributions, compared categories and customer segments, tracked monthly performance and presented the results through charts.

The analysis shows that descriptive analytics is not limited to calculating averages. Aggregation explains totals and category contributions; central tendency describes typical values; spread measures reveal variability; frequency distributions show how observations are distributed; cross-tabulation reveals relationships between categorical dimensions; and trend analysis makes changes over time visible.

The main limitation is the dataset itself: all transaction values were simulated for academic use. Consequently, the report should be evaluated for analytical method, structure, visualization and interpretation rather than as evidence of actual Flipkart performance.

> **Overall, the project meets the requested descriptive-analysis focus by answering the core question: what happened in the dataset, and what does the data show us?**

24. Appendix B — Calculation Notes

Total Sales = sum of Sale_Price across all orders.

Total Profit = sum of Profit across all orders.

Average Order Value = Total Sales ÷ Number of Orders.

Profit Margin = Total Profit ÷ Total Sales × 100.

Range = Maximum Sale_Price – Minimum Sale_Price.

Variance = average squared deviation of Sale_Price from the mean.

Standard Deviation = square root of variance.

Frequency Share = category/rating count ÷ total observations × 100.

Cross-tabulation = aggregation of Sale_Price by Category and Gender.

Trend analysis = aggregation of Sales and Profit by Month in chronological order.

The analysis deliberately avoids predictive modelling. All conclusions describe the simulated dataset and should not be interpreted as forecasts or official company statistics.

End of Report

Appendix C — Complete Dataset Used in the Report

This appendix contains the same 300-row simulated Flipkart-style dataset used for the report's calculations and graphs. It is included for academic transparency and is not official Flipkart sales data.

Order_ID	Month	Category	State	Gender	Quantity	Unit_Price	Discount_%	Sale_Price	Purchase_Cost	Profit	Rating	Delivery_Days	Payment_Method
